

AbortPath

The **AbortPath** function closes and discards any paths in the specified device context.

```
BOOL AbortPath(  
    HDC hdc        // handle of device context  
);
```

Parameters

hdc

Identifies the device context from which a path will be discarded.

Return Value

If the function succeeds, the return value is TRUE.

If the function fails, the return value is FALSE. To get extended error information, call [GetLastError](#).

Remarks

If there is an open path bracket in the given device context, the path bracket is closed and the path is discarded. If there is a closed path in the device context, the path is discarded.
